# Recent advances on hypoplasticity with explicit asymptotic states

#### David Mašín

Faculty of Science Charles University in Prague

IV International Workshop on Modern Trends in Geomechanics, Assisi, 17. 5. 2016

## Outline

Explicit incorporation of asymptotic states into hypoplasticity

Recent developments and applications of the framework

- Incorporation of stiffness anisotropy
- Variable ASBS shape in spudcan simulations
- Coupled Thermo-Hydro-Mechanical double structure model for partially saturated expansive clays
- ASBS anisotropy soft clay modelling
- Modelling of peat

## Asymptotic states

 Asymptotic behaviour addressed in the lecture by *Prof. Kolymbas*: each *strain increment direction* is associated with the *asymptotic stress increment direction* and with the void ratio vs. mean stress dependency (*normal compression line*).

## Asymptotic states

 Asymptotic behaviour addressed in the lecture by *Prof. Kolymbas*: each *strain increment direction* is associated with the *asymptotic stress increment direction* and with the void ratio vs. mean stress dependency (*normal compression line*).

General hypoplastic equation:

 $\mathring{\sigma} = f_{\mathcal{S}}(\mathcal{L} : \mathbf{D} + f_{\mathcal{d}}\mathbf{N}\|\mathbf{D}\|)$ 

Principle of derivation: normalised stress  $\sigma_n = \sigma/p_e^*$  does not change in asymptotic loading.

General hypoplastic equation:

 $\mathring{\boldsymbol{\sigma}} = f_{\mathcal{S}}(\mathcal{L} : \mathbf{D} + f_{\mathcal{O}}\mathbf{N}\|\mathbf{D}\|)$ 

Principle of derivation: normalised stress  $\sigma_n = \sigma/p_e^*$  does not change in asymptotic loading.

General hypoplastic equation:

 $\mathring{\boldsymbol{\sigma}} = f_{\mathcal{S}}(\mathcal{L} : \mathbf{D} + f_{\mathcal{O}}\mathbf{N}\|\mathbf{D}\|)$

The rate of normalised stress follows from its definition  $\sigma_n = \sigma / \rho_e^*$ 

$$\dot{\sigma}_n = rac{\dot{\sigma}}{p_e^*} - rac{\sigma}{p_e^{*2}}\dot{p}_e^*$$

Let's now select an expression for the isotropic normal compression line. We choose the Butterfield (1979) law

$$\ln(1+e) = N - \lambda^* \ln(p_e^*/p_r)$$

from which follows

$$\dot{oldsymbol{
ho}}_{oldsymbol{arepsilon}}^* = -rac{oldsymbol{
ho}_{oldsymbol{arepsilon}}}{\lambda^*}\,{
m tr}\,{f D}$$

and thus

$$\dot{\sigma}_n = rac{f_s}{
ho_e^*} \left( \mathcal{L} : \mathbf{D} + f_d \mathbf{N} \| \mathbf{D} \| 
ight) + rac{\sigma}{
ho_e^* \lambda^*} \operatorname{tr} \mathbf{D}$$

David Mašín (Charles University in Prague)

The rate of normalised stress follows from its definition  $\sigma_n = \sigma / \rho_e^*$ 

$$\dot{\sigma}_n=rac{\dot{\sigma}}{p_e^*}-rac{\sigma}{p_e^{*2}}\dot{p}_e^*$$

Let's now select an expression for the isotropic normal compression line. We choose the Butterfield (1979) law

$$\ln(1+e) = N - \lambda^* \ln(p_e^*/p_r)$$

from which follows

$$\dot{oldsymbol{
ho}}_{oldsymbol{e}}^{*}=-rac{oldsymbol{
ho}_{oldsymbol{e}}^{*}}{\lambda^{*}}$$
 tr D

and thus

$$\dot{\sigma}_n = rac{f_s}{p_e^*} \left( \mathcal{L} : \mathbf{D} + f_d \mathbf{N} \| \mathbf{D} \| \right) + rac{\sigma}{p_e^* \lambda^*} \operatorname{tr} \mathbf{D}$$

David Mašín (Charles University in Prague)

#### Explicit asymptotic states in hypoplasticity

As already indicated,  $\sigma_n$  is constant during proportional loading. Thus,  $\dot{\sigma}_n = \mathbf{0}$ , and

$$-\frac{\sigma}{\lambda^*} \operatorname{tr} \mathbf{D}^{A} = f_{s} \left( \mathcal{L} : \mathbf{D}^{A} + f_{d}^{A} \mathbf{N} \| \mathbf{D}^{A} \| \right)$$
$$- \left( \frac{\sigma}{\lambda^*} \operatorname{tr} \mathbf{D}^{A} + f_{s} \mathcal{L} : \mathbf{D}^{A} \right) = f_{s} f_{d}^{A} \mathbf{N} \| \mathbf{D}^{A} \|$$
$$\mathbf{I} : \mathbf{D}^{A} = f_{s} f_{d}^{A} \mathbf{N} \| \mathbf{D}^{A} \| \quad \text{with} \quad \mathcal{A} = f_{s} \mathcal{L} + \frac{\sigma}{\lambda^*} \otimes \mathbf{1}$$

 $-\mathcal{A}: \boldsymbol{d} = f_s f_d^A \mathbf{N}$  with  $\boldsymbol{d} = \frac{\mathbf{D}^A}{\|\mathbf{D}^A\|}$ 

David Mašín (Charles University in Prague) Asymptotic states in hypoplasticity

- .

#### Explicit asymptotic states in hypoplasticity

As already indicated,  $\sigma_n$  is constant during proportional loading. Thus,  $\dot{\sigma}_n = \mathbf{0}$ , and

$$-\frac{\sigma}{\lambda^*} \operatorname{tr} \mathbf{D}^{\mathcal{A}} = f_{\mathcal{S}} \left( \mathcal{L} : \mathbf{D}^{\mathcal{A}} + f_{\mathcal{C}}^{\mathcal{A}} \mathbf{N} \| \mathbf{D}^{\mathcal{A}} \| \right)$$
$$- \left( \frac{\sigma}{\lambda^*} \operatorname{tr} \mathbf{D}^{\mathcal{A}} + f_{\mathcal{S}} \mathcal{L} : \mathbf{D}^{\mathcal{A}} \right) = f_{\mathcal{S}} f_{\mathcal{C}}^{\mathcal{A}} \mathbf{N} \| \mathbf{D}^{\mathcal{A}} \|$$
$$\mathbf{A} : \mathbf{D}^{\mathcal{A}} = f_{\mathcal{S}} f_{\mathcal{C}}^{\mathcal{A}} \mathbf{N} \| \mathbf{D}^{\mathcal{A}} \| \quad \text{with} \quad \mathcal{A} = f_{\mathcal{S}} \mathcal{L} + \frac{\sigma}{\lambda^*} \otimes \mathbf{1}$$

$$-\mathcal{A}: \mathbf{d} = f_{s}f_{d}^{A}\mathbf{N}$$
 with  $\mathbf{d} = \frac{\mathbf{D}^{A}}{\|\mathbf{D}^{A}\|}$ 

David Mašín (Charles University in Prague) Asymptotic states in hypoplasticity

イロト 不得 トイヨト イヨト

.

So, we now have

$$-\mathcal{A}$$
:  $\boldsymbol{d} = f_{s}f_{d}^{A}\mathbf{N}$ 

 $\mathbf{N} = -\frac{\boldsymbol{\mathcal{A}} : \boldsymbol{\boldsymbol{d}}}{f_{\star} f^{\boldsymbol{\mathcal{A}}}}$ 

which also means

This expression for **N** can be substituted back into the original hypoplastic equation Which can be manipulated to

Which can be manipulated to

$$\dot{\sigma} = f_{s} \mathcal{L} : \mathbf{D} - f_{d} \left( \frac{\mathcal{A} : \boldsymbol{d}}{f_{d}^{A}} \right) \|\mathbf{D}\|$$

This equation *inherently* implies normal compression behaviour according to the Butterfield (1979) law.  $f_d^A$  controls the shape of the state boundary surface, and **d** is the asymptotic strain rate direction. Any shape of the ASBS can be included, as in elastop plasticity.

So, we now have

$$-\mathcal{A}$$
:  $\boldsymbol{d} = f_{s}f_{d}^{A}\mathbf{N}$ 

which also means

$$\mathbf{N} = -\frac{\boldsymbol{\mathcal{A}}:\boldsymbol{d}}{f_{s}f_{d}^{A}}$$

This expression for  ${\bf N}$  can be substituted back into the original hypoplastic equation

Which can be manipulated to

$$\dot{\sigma} = f_{\mathcal{S}} \mathcal{L} : \mathbf{D} - f_{\mathcal{C}} \left( \frac{\mathcal{A} : \mathbf{d}}{f_{\mathcal{C}}^{A}} \right) \|\mathbf{D}\|$$

This equation *inherently* implies normal compression behaviour according to the Butterfield (1979) law.  $f_d^A$  controls the shape of the state boundary surface, and **d** is the asymptotic strain rate direction. Any shape of the ASBS can be included, as in elastop plasticity.

So, we now have

$$-\mathcal{A}$$
:  $\boldsymbol{d} = f_{s}f_{d}^{A}\mathbf{N}$ 

which also means

$$\mathbf{N} = -\frac{\boldsymbol{\mathcal{A}}:\boldsymbol{d}}{f_{s}f_{d}^{A}}$$

This expression for **N** can be substituted back into the original hypoplastic equation Which can be manipulated to

$$\dot{\boldsymbol{\sigma}} = f_{\mathcal{S}} \mathcal{L} : \mathbf{D} - f_{d} \left( \frac{\mathcal{A} : \boldsymbol{d}}{f_{d}^{A}} \right) \|\mathbf{D}\|$$

This equation *inherently* implies normal compression behaviour according to the Butterfield (1979) law.  $f_d^A$  controls the shape of the state boundary surface, and **d** is the asymptotic strain rate direction. Any shape of the ASBS can be included, as in elastopplasticity.

So, we now have

$$-\boldsymbol{\mathcal{A}}: \boldsymbol{d} = f_s f_d^{\boldsymbol{\mathcal{A}}} \mathbf{N}$$

which also means

$$\mathbf{N} = -\frac{\boldsymbol{\mathcal{A}}:\boldsymbol{d}}{f_{s}f_{d}^{A}}$$

This expression for  $\mathbf{N}$  can be substituted back into the original hypoplastic equation

Which can be manipulated to

$$\dot{\boldsymbol{\sigma}} = f_{\mathcal{S}} \boldsymbol{\mathcal{L}} : \mathbf{D} - f_{\mathcal{d}} \left( \frac{\boldsymbol{\mathcal{A}} : \boldsymbol{d}}{f_{\mathcal{d}}^{A}} \right) \|\mathbf{D}\|$$

This equation *inherently* implies normal compression behaviour according to the Butterfield (1979) law.  $f_d^A$  controls the shape of the state boundary surface, and **d** is the asymptotic strain rate direction. Any shape of the ASBS can be included, *as in elasto-plasticity*.

- Clay hypoplastic model from [Mašín, D. (2013). Clay hypoplasticity with explicitly defined asymptotic states. Acta Geotechnica 8, No. 5, 481-496.].
- Asymptotic state boundary surface of the new clay hypoplastic model is bound within the *compression stress range*.

イロト 不得 トイヨト イヨト

- Clay hypoplastic model from [Mašín, D. (2013). Clay hypoplasticity with explicitly defined asymptotic states. Acta Geotechnica 8, No. 5, 481-496.].
- Asymptotic state boundary surface of the new clay hypoplastic model is bound within the *compression stress range*.

 A shape of the asymptotic state boundary surface, which has Matsuoka-Nakai (1974) deviatoric cross-sections

• The new model improves predictions when compared with the original 2005 model.

Asymptotic states in hypoplasticity

• Soil used in the experiments is *sensitive* (it has *meta-stable structure*).

Rate of structure degradation controlled by a parameter k in the model

$$\dot{\boldsymbol{s}} = -rac{\boldsymbol{k}}{\lambda^*}(\boldsymbol{s}-\boldsymbol{s}_{f})\dot{\epsilon}^{d}$$

Cotecchia and Chandler, 2000

IV MTG, 17. 5. 2016 24 / 48

 Numerical simulation can be used to visualise structure degradation around the spudcan. Plots are showing current sensitivity

Left: *lower rate* of structure degradation k=0.05

Right: *higher rate* of structure degradation k=0.2

## Double structure model for expansive soils

 Expansive clay soils have double-porous structure. The behaviour of aggregates differ from the behaviour of macrostructure, which forms a material with apparently larger particles (double structure modelling concept by Alonso et al., 1999).

< ロ > < 同 > < 回 > < 回 >

Two mechanical models (macrostructure G<sup>M</sup> and microstructure G<sup>m</sup>), defined using effective stresses σ<sup>M</sup> and σ<sup>m</sup>.

$$\dot{\sigma}^{M} = \mathbf{G}^{M}(\sigma^{M}, \boldsymbol{q}^{M}, \dot{\epsilon}^{M}) \text{ with } \sigma^{M} = \sigma^{net} - \mathbf{1}s\chi^{M}$$
  
 $\dot{\sigma}^{m} = \mathbf{G}^{m}(\sigma^{m}, \boldsymbol{q}^{m}, \dot{\epsilon}^{m}) \text{ with } \sigma^{m} = \sigma^{net} - \mathbf{1}s\chi^{m}$ 

• Two *water retention models* (**H**<sup>*M*</sup> and **H**<sup>*m*</sup>) using micro- and macrostructural *S*<sub>*r*</sub>.

$$\dot{S}^M_r = H^M(\dot{s}, s, \dot{\epsilon}^M)$$
  
 $\dot{S}^m_r = H^m(\dot{s}, s, \dot{\epsilon}^m)$ 

Two mechanical models (macrostructure G<sup>M</sup> and microstructure G<sup>m</sup>), defined using effective stresses σ<sup>M</sup> and σ<sup>m</sup>.

$$\dot{\sigma}^{M} = \mathbf{G}^{M}(\sigma^{M}, \boldsymbol{q}^{M}, \dot{\epsilon}^{M}) \quad \text{with} \quad \sigma^{M} = \sigma^{net} - \mathbf{1}s\chi^{M} \\ \dot{\sigma}^{m} = \mathbf{G}^{m}(\sigma^{m}, \boldsymbol{q}^{m}, \dot{\epsilon}^{m}) \quad \text{with} \quad \sigma^{m} = \sigma^{net} - \mathbf{1}s\chi^{m}$$

• Two *water retention models* (**H**<sup>*M*</sup> and **H**<sup>*m*</sup>) using micro- and macrostructural *S*<sub>*r*</sub>.

$$\dot{S}^M_r = H^M(\dot{s},s,\dot{\epsilon}^M) \ \dot{S}^m_r = H^m(\dot{s},s,\dot{\epsilon}^m)$$

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Two mechanical models (macrostructure G<sup>M</sup> and microstructure G<sup>m</sup>), defined using effective stresses σ<sup>M</sup> and σ<sup>m</sup>.

$$\dot{\sigma}^{M} = \mathbf{G}^{M}(\sigma^{M}, \boldsymbol{q}^{M}, \dot{\epsilon}^{M}) \text{ with } \sigma^{M} = \sigma^{net} - \mathbf{1}s\chi^{M}$$
  
 $\dot{\sigma}^{m} = \mathbf{G}^{m}(\sigma^{m}, \boldsymbol{q}^{m}, \dot{\epsilon}^{m}) \text{ with } \sigma^{m} = \sigma^{net} - \mathbf{1}s\chi^{m}$ 

• Two *water retention models* (**H**<sup>*M*</sup> and **H**<sup>*m*</sup>) using micro- and macrostructural *S*<sub>*r*</sub>.

$$\dot{S}^{M}_{r} = H^{M}(\dot{s}, s, \dot{\epsilon}^{M}) \ \dot{S}^{m}_{r} = H^{m}(\dot{s}, s, \dot{\epsilon}^{m})$$

• Two mechanical models (macrostructure  $\mathbf{G}^{M}$  and microstructure  $\mathbf{G}^{m}$ ), defined using *effective stresses*  $\sigma^{M}$  and  $\sigma^{m}$ .

$$\dot{\sigma}^{M} = \mathbf{G}^{M}(\sigma^{M}, \mathbf{q}^{M}, \dot{\epsilon}^{M}) \text{ with } \sigma^{M} = \sigma^{net} - \mathbf{1}s\chi^{M}$$

$$\dot{\sigma}^{m} = \mathbf{G}^{m}(\sigma^{m}, \mathbf{q}^{m}, \dot{\epsilon}^{m}) \text{ with } \sigma^{m} = \sigma^{net} - \mathbf{1}s\chi^{m}$$
Two water retention models ( $\mathbf{H}^{M}$  and  $\mathbf{H}^{m}$ ) using micro- and macrostructural  $S_{r}$ .  

$$\dot{S}_{r}^{M} = H^{M}(\dot{s}, s, \dot{\epsilon}^{m})$$

• Hydro-mechanical coupling: Hydraulic strain measure  $S_r^M$  depends on mechanical quantity  $\dot{\epsilon}^M$ . Mechanical response influenced by  $\chi^M$ , which may depend on a hydraulic quantity  $S_r^M$ .

• Coupling between the two structural levels:

 $\dot{\epsilon} = \dot{\epsilon}^M + f_m \dot{\epsilon}^m$ 

where  $0 \le f_m \le 1$  specifies occlusion of macropores by microstructure.  $f_m$  is a function of *relative density*.

⇒ f<sub>m</sub> = 0 ... aggregates can freely swell into macrovoids without imposing global deformation - typical behaviour of *open* structure.
 ⇒ f<sub>m</sub> = 1 ... aggregates cannot ocupy the macrovoids, global strain is equal to aggregate strain - typical behaviour of *dense structure*.

3

## Thermo-hydro-mechanical model

Thermal effects have been incorporated recently: [Mašín, D. (2016). Coupled thermo-hydro-mechanical double structure model for expansive soils, Journal of Engineering Mechanics ASCE (under review)].

General rate expression of the model reads:

 $\mathring{\sigma}^{M} = f_{S} \left[ \mathcal{L} : (\mathbf{D} - f_{m} \mathbf{D}^{m}) + f_{d} \mathbf{N} \| \mathbf{D} - f_{m} \mathbf{D}^{m} \| \right] + f_{u} \left( \mathbf{H}_{S} + \mathbf{H}_{T} \right)$ 

 $\Rightarrow$  For prescribed **D**,  $\dot{s}$  and  $\dot{T}$  the formulation is implicit!

## Thermo-hydro-mechanical model
